

AGB Prescription Mix

For Reduced Cost and Ease of Application

Description

Prescription mix formulations by Agmin are based on soil and plant tissue analyses performed by ASPAC accredited laboratories. The obtained analytical result will indicate the nutrients that are in deficiency or excess in soil and plant. Based on these results the fertilizer requirement is formulated specifically for your soil and the plants needs. The prescription mix may then be applied by boomspray, mister, or aerial spray.

All the nutrient elements in your prescription mix are protected by a complex process called chelation. This prevents the interaction of other elements and soil conditions which may render nutrients unavailable, hence maximum nutrient availability and utilization is achieved.

The formulated protecting agent provides maximum absorption and translocation into and within the plant releasing the nutrients at the required sites. It also incorporates binding and penetrating agents, which minimise the effect of leaching and provide optimal absorption levels, without scorching.

General Application Rates

- **As per prescription mix label and instructions.**

The application rates above are guidelines. Agmin always recommends consultation with your local agronomist to base the application rates on soil and plant tissue testing, paddock history, environmental factors, soil conditions, and crop type. For more information on these topics please see Agmin's brochure marked "Foliar Nutrients".

Contact Details

Contact us on the information below to find out the closest rural store that stocks Agmin products.

Manufactured by: Agmin Chelates Pty Ltd
32 Wattlepark Avenue,
Moolap, Victoria 3221

Telephone: 1800 154 433
Facsimile: 1800 154 332
Email: service@agmin.com.au
Web: www.agmin.com.au

Constituents

As per soil test or plant tissue analysis.

The Agmin Benefit

Agmin is at the forefront of research and development of chelated (protected) liquid nutrient fertilizers. The efficacy of foliar absorption of fertilizer elements is targeted to be optimized by binding agents assisting in rain fastness, penetrants to open increased number and area of pore sites, and surfactants to reduce surface tension of liquid droplets on plant surfaces. The formulations development is to prevent the greatest financial losses in fertilization, that is, the fixation of soil nutrients by adverse soil reactions. Agmin is committed in delivering quality products with high nutrient absorption and utilization for increased crop productivity and profit.
