

AGB Manganese Chelate

Description

Manganese deficiency appears as interveinal yellowing in young leaves. In grasses, brownish spots or streaks appear at the base to middle part of younger leaves.

The causes of Manganese deficiency may occur for several reasons :

- Soil is high in phosphorous, calcium and magnesium.
- Liming of acid soils.
- High soil pH.
- Heavily leached sands and light textured soils.

Agmin's AGB Manganese Chelate is nutrient highly protected from becoming unavailable through fixation in the soil by adverse reactions. It has a high plant availability, is quickly absorbed by leaves and is rain fast.

For further information please contact Agmin on the details below.

General Application Rates

- **Slight Deficiency (Maintenance):** 2.0 L/Ha
- **Moderate Deficiency:** 5.0 L/Ha
- **Severe Deficiency:** 8.0 L/Ha

The application rates above are guidelines. Agmin always recommends consultation with your local agronomist to base the application rates on soil and plant tissue testing, paddock history, environmental factors, soil conditions, and crop type. For more information on these topics please see Agmin's brochure marked "Foliar Nutrients".

Constituents

Minimum Guaranteed Analysis

Manganese (Mn)	6.00	% w/v
Sulphur (S)	2.40	% w/v

with lignosulphonate binder; surfactants; penetrants.

The Agmin Benefit

Agmin is at the forefront of research and development of chelated (protected) liquid nutrient fertilizers. The efficacy of foliar absorption of fertilizer elements is targeted to be optimized by binding agents assisting in rain fastness, penetrants to open increased number and area of pore sites, and surfactants to reduce surface tension of liquid droplets on plant surfaces. The formulations development is to prevent the greatest financial losses in fertilization, that is, the fixation of soil nutrients by adverse soil reactions. Agmin is committed in delivering quality products with high nutrient absorption and utilization for increased crop productivity and profit.
